## Sub Cover Security System

### PRODUCT OVERVIEW

In today's world an increasing amount of reliance is placed on data communication and the importance of securing their networks is becoming paramount to service providers. With the vandalism of underground network equipment increasing it has been identified over recent years that a means of securing the chamber is highly important.

The system design is made up of three folded steel plates which are then supported on steel angles which are bolted to the chamber walls and then secured into place with a locking bar and padlock. The padlock is then protected from attack by another steel plate.

The speed and ease of installation are just two of the major advantages of the Sub Cover Security System. Only eight holes are needed to be drilled on site which means the chamber can be opened, the system fitted and access covers & frames replaced in twenty minutes. This system design has been independently tested for the manufacturer to Category C of Loss Prevention Board Standard 1175 and has resisted a prolonged attack using heavy hand tools for a period in excess of twenty minutes.

### KEY FEATURES

Installation in under 20 minutes.

Components are all hot dip galvanised to EN1461.

System is easily retro-fitted to any footway or carriageway chamber.

Minimal clear opening intrusion.
